Sea Blue Histiocytosis

Other names that may be used for this disorder are:

- SBHS
- Sea-Blue Histiocyte Disease

Sea Blue Histiocytosis is a disorder that is characterised by sea blue histiocytes in the bone marrow. Histiocytes are cells that are part of the immune system and are derived from the bone marrow. In this disorder there are numerous histiocytes that contain granules that appear blue or green when they are stained with a fluid called Wright-Giemsa. Sea blue histiocytosis can be associated with some metabolic and blood disorders.

Treatment aims to provide relief for any symptoms and support in the care of the individual.
